This R&D project comprises a set of logically related phases (tasks). Each phase – apart from the first one – directly utilizes the result products of the previous phase by making the directions for research and development dependent upon their results. The program is made up of the following four consecutive phases:

1. The Establishment of Telemedicine Protocol Repository
2. Protocol Analysis
3. TELeHEALTH system design
4. TELeHEALTH system development

- TELeHEALTH Central Base System Development
- Development and Matching of Endpoint Devices for TELeHEALTH System

The respective work stages encompass industrial research and development phases.
